Team strength

Collaboration and communication: We excel in teamwork and clear communication, allowing us to manage group dynamics effectively and maintain consistent project visibility.

Analytical and creative problem solving: We combine critical thinking with creative problem solving to address complex requirements and navigate potential project risks.

Documentation and research: Our team demonstrates rigorous attention to details in research and documentation, ensuring all project deliverables are well structured and professionally presented.

Leadership in organization: We maintain strong leadership and organization skills which enable us to meet deadlines and handle unexpected challenges efficiently.

Technical proficiency: Our team possesses foundation in programming and software engineering principles ensuring high quality code development and system architecture.

2.Team Charter

Communication methods

Primary channel: WhatsApp is used for daily communication, quick questions, and informal coordination. Virtual meetings are also held using Microsoft Teams.

Technical communications: GitHub is the system of record for technical discussions, task tracking, and project history.

Formal communication: Email or shared documents are used for official updates with links stored in the GitHub repositories documentation folder.

Response time

- General WhatsApp update requires a response within 24 hours.
- Urgent or blocking WhatsApp messages require a response within four to six hours on the same day.
- Pull request reviews on GitHub are expected within 48 hours.
- Assigned GitHub issues must be acknowledged within 24 hours.

Meeting attendance and coordination

Attendance: Meetings are mandatory; absences must be communicated at least two hours in advance. Two unexcused absences per month result in a one-on-one check-in with the team lead

Coordination: A recurring weekly meeting is held for status updates and planning.

Meeting roles: Each meeting has a facilitator, a note taker, and a timekeeper.

Minutes: Minutes must be posted to the repositories slash docs folder within 24 hours.

Work division and participation.

- All members are expected to contribute equal effort throughout the project.
- Contributions are tracked transparently via GitHub comments, issue assignments, and meeting attendance.

Version control and submission

- All codes and documentations are managed in a central GitHub repository.
- Direct pushes to their main branch are prohibited; work must be merged via pull request after at least one other member approves the changes.
- Meaningful commit messages are required, and unnecessary files should be avoided.

Conflict resolution

- Disagreements follow an escalation path: private conversation, then team discussion, then team lead mediation, and finally supervisor involvement.
- Technical disputes are settled through evidence, testing, or a majority vote.

Unexpected situations

- If a member is inactive or fails to contribute, the team lead documents specific instances of missed work.
- The members provided an opportunity to correct their behavior before the team escalates the issue to the supervisor.

3. Client Intake

Client Information

Client's name: Brain Adjei-Otchwemah

Business name: MediaForUs

Business Type: Photography Services

CONTACT INFORMATION

Email: brain@mediaforus.live

Business Description

Media For Us is a creative media and photography business that specializes in providing professional photography services for individuals, events, and organizations. The business focuses on capturing high quality images and creating visual content that preserves memorable moments and supports brand promotion. Its services include event photography, portrait photography, photo editing, and media content creation. The business aims to deliver professional, creative, and customer focused services while building a strong visual presence for its clients. As its client base continues to grow, there is a need for a modern digital platform that displays its portfolio, promotes its services, and enables clients to make enquiries and bookings online.

Proposed System

Project Title: Lenslink-Photography Portfolio and Booking System

System Description: The team proposes to develop a photography portfolio and booking system that will allow customers to:

- View photography portfolios
- Explore services and packages.
- Book appointments
- Contact the photographer.

The system will also allow the client to:

- Manage bookings.
- Upload the managed photographs.
- Update services and information.

Initial requirements

- Display the photography portfolio.
- Provide information about services offered.
- Allow clients to make bookings or inquiries.
- Enable the administrator to manage photos and contents.
- Ensure the website is user friendly and accessible.

These requirements are preliminary and subject to change following a detailed consultation and requirement elicitation session with the client.

4. Repository setup

Repository platform: GitHub

Repository names

- Lenslink frontend
- Lenslink backend

Repository links

<https://github.com/zenithdavid/lenslink-frontend.git>

<https://github.com/zenithdavid/lenslink-backend.git>

Collaborators

- zenithdavid
- Theresacommey
- OsmanMoomen1
- KennethOwusu12345
- EmmanuelEssiamah
- Dkamanfu
- Stephwilly

Repository organization

The project repository is organized into separate front end and back-end repositories to ensure proper code management, collaboration, and version control among team members.

5. AI contract

The team agrees to use artificial intelligence tools responsibly throughout the project.

AI usage policy

1. AI tools may be used for brainstorming and idea generation.
2. AI may assist with drafting documentation.
3. All AI generated content must be reviewed and verified by team members.
4. All AI generated code must be tested before implementation.
5. AI shall not replace individual learning or participation.
6. The team remains responsible for all submitted work.
7. Team members use AI ethically in accordance with university regulations.
